SUMMARY

Software Engineer with 1.5+ years at Accenture designing and delivering enterprise applications across industrial telemetry, application observability, and AI-integrated user-facing systems. Proficient in Python, React.js, FastAPI, TypeScript, and C# with hands-on experience building production AI features including LLM-driven workflows, RAG pipelines with vector retrieval, and intelligent diagnostics platforms. Triple cloud-certified (AWS CCP, GCP ACE, Azure AI) with strong foundation in OOP, REST API design, CI/CD, and secure coding practices. MMA Award recipient for Client Value Creation.

TECHNICAL SKILLS

Languages: Python, JavaScript, TypeScript, C#, Java, C/C++, SQL

Frontend: React.js, Next.js, Redux, Tailwind CSS, HTML5/CSS3

Backend & APIs: FastAPI, ASP.NET Razor, Node.js, RESTful APIs, Microservices, WebSocket, Postman

AI / ML: LLM Integration (LLaMA 3.2, Gemini), RAG Pipelines, Prompt Engineering, NLP, HuggingFace Transformers, PyTorch, ONNX

Databases: MongoDB, MySQL, PostgreSQL, Qdrant (Vector DB)

Cloud & DevOps: AWS, GCP, Azure, Docker, Terraform, CI/CD, Git

Practices: OOP, SOLID Principles, WCAG Compliance, Agile/Scrum

EXPERIENCE

Associate Software Engineer · Accenture, Pune

Sept 2024 – Present

Award: MMA — Core Values: Client Value Creation (Sept 2025): Recognized for resolving 50+ WCAG accessibility violations across 12+ screens on an enterprise client application, achieving full compliance.

ARGUS-AI — Application Observability & Incident Diagnostics

- Developed core modules of ARGUS-AI, an AI-driven observability platform that ingests and correlates application logs, metrics, and alert streams — replacing manual log-search workflows where engineers previously had to grep through distributed log files across multiple services to identify root causes.
- Built a conversational investigation interface enabling engineers to query incidents in natural language, surfacing probable root causes and affected services within seconds of alert trigger — eliminating the need for manual cross-referencing of dashboards, log viewers, and metric explorers.
- Implemented an automated remediation recommendation engine that matches live incidents against historical resolution patterns and system telemetry, generating ranked troubleshooting steps — replacing the prior workflow of searching Confluence runbooks and Slack threads for similar past incidents.
- Integrated Generative AI to produce concise incident summaries and actionable next-step guidance that could be directly shared with stakeholders — replacing manually written postmortem drafts that previously required senior engineer involvement.

Telemetry Dashboard — Fleet Analytics & Predictive Maintenance

- Designed and developed an intelligent telemetry dashboard for real-time monitoring of vehicle and engine performance data across industrial fleets — integrating LLaMA 3.2 and a RAG pipeline with Qdrant vector retrieval to consolidate multi-source data into a unified AI-powered decision-support interface.
- Implemented natural language querying over telemetry datasets, allowing non-technical stakeholders to extract fleet insights conversationally — replacing the prior dependency on engineering teams to write and run manual SQL queries for every reporting request.
- Built predictive maintenance dashboards that scored engine health, flagged emerging fault trends, and projected maintenance windows using time-series analytics combined with Gen-AI-generated contextual explanations — enabling maintenance teams to shift from reactive break-fix to proactive scheduling.

Enterprise Web Application Remediation & DevOps

- Remediated 50+ WCAG accessibility violations across 12+ screens on enterprise B2B/B2C applications (React.js, C#, ASP.NET Razor), maintaining secure coding standards and contributing to peer code reviews across the delivery team.
- Diagnosed and resolved a recurring Azure deployment failure caused by HTML injection timing issues in the React.js frontend — implemented a MutationObserver-based solution that eliminated the failure entirely, stabilizing a release pipeline that had been breaking multiple times weekly.

PROJECTS

Marlish.AI — Real-Time Indian Chat Language Translator

Personal Project · github.com/SanketShendge21/MarlishAI

- Built a full-stack AI translation platform that converts Hinglish/Marlish (romanized Hindi/Marathi chat language) into natural English, Hindi, and Marathi — solving code-mixing, phonetic variance, and SOV→SVO grammar mismatches that Google Translate consistently fails on for informal Indian chat input.
- Engineered a custom 8-layer rule-based NLP pipeline in JavaScript (normalization, intent matching, compound verb assembly, contextual disambiguation, SOV→SVO grammar reordering, confidence scoring, beautification) achieving sub-5ms per-keystroke latency via O(1) dictionary lookups — making real-time translation feasible without server round-trips.
- Designed a Two-Tier Hybrid Architecture: Tier 1 (in-browser JS rule engine) handles common inputs instantly; Tier 2 (NLLB-200-1.3B via GPU-accelerated FastAPI + Gemini GEC post-processing) handles complex translations — with a custom Python transliteration pipeline bridging romanized input to Devanagari-native NMT models.
- Curated 18.5M parallel sentence pairs across 8 translation directions, set up mT5-small fine-tuning with ONNX INT8 quantization (<40MB) for browser deployment, and deployed via Vercel + Hugging Face Spaces (Docker/T4 GPU) with PWA offline-first support.

Tech: Next.js 16, React 19, Tailwind CSS v4, FastAPI, PyTorch, HuggingFace Transformers, NLLB-200, mT5, ONNX, Gemini API, Docker, Vercel, HF Spaces

Healthcare IoT Monitoring Device — ML-Assisted Diagnostics

Oct 2023 – Apr 2024

- Designed a real-time IoT patient monitoring device integrating ML algorithms for early disease detection across multiple vital signs, resulting in a published paper in IJNRD (Vol. 8, Issue 11, Nov 2023).

Tech: NLP, IoT, AWS Cloud, ECC, Time Series Analysis

PUBLICATION

Revolutionizing Healthcare Delivery: A Comprehensive Review of Chatbot-enabled Systems Integrating Real-time Sensor Data and Cloud Computing
